Database Design Report XML Output Grammar

This document describes the FileMaker® Pro 11 Advanced Database Design Report (DDR) XML output grammar. The DDR XML format is useful for advanced users and developers who want to create tools that analyze or process the structure of databases.

PrivilegeSet Section.....	38
Authorized Files Section.....	44
ExtendedPrivilege Section	44
Custom Menu Set Section.....	45
Custom Menu Section.....	46
Custom Function Section	48
Script Section	49

Overview (Summary) Section

Tag Name	Value	Description
<FMPReport	—	The top most parent node
type="Summary"	Can have one of the following values: <ul style="list-style-type: none">■ Summary■ Report	Stores the type of the XML report file. This value is used by the XSL file to determine if we are in summary mode or report mode.
version="11.0v1"	FMPPro Advanced version/vrev	Version/vrev of FileMaker Pro Advanced that generated this report.
creationDate="1/1/2010"	Date string based on the system's locale.	Contains the creation date of the report.
creationTime="2:00 pm">	Time string based on the system's locale.	Contains the creation time of the report.
<FMPReport><File	—	XML node that contains the information about the database file report such as the original filename, the path of the report directory and the XML report filename.
name="testfile.fp7"	Valid filename based on the OS platform.	No validation is performed in the text string content. It is only used for display.
path="C:\test"	Platform specific file path.	Path of the XML report file of the database file.

Tag Name	Value	Description
link="testfile_fp7.xml">	Valid filename based on the OS platform.	Contains the XML detail report filename.
<FMPReport><File><BaseTables count="2">	Any numeric value.	Shows the number of base tables found in the database referenced under <File Name> attribute.
<FMPReport><File><Tables count="2">	Any numeric value.	Shows the number of tables (occurrences) found in the database referenced under <File Name> attribute.
<FMPReport><File><Accounts count="2">	Any numeric value.	Shows the number of user accounts found in the database referenced under <File Name> attribute.
<FMPReport><File><Privileges count="2">	Any numeric value.	Number of privilege sets found in the database referenced under <File Name><File Name> attribute.
<FMPReport><File><ExtendedPrivileges count="4">	Any numeric value.	Number of extended privileges found in the database referenced under <File Name> attribute.
<FMPReport><File><Layouts count="2">	Any numeric value.	Number of layouts found in the database referenced under <File Name> attribute.
<FMPReport><File><Scripts count="2">	Any numeric value.	Number of scripts found in the database referenced under <File Name> attribute.
<FMPReport><File><Relationships count="2">	Any numeric value.	Number of relationships found in the database referenced under <File Name> attribute.
<FMPReport><File><ValueLists count="2">	Any numeric value.	Number of value lists found in the database referenced under <File Name> attribute.
<FMPReport><File><CustomFunctions count="2">	Any numeric value.	Number of custom functions found in the database referenced under <File Name> attribute.
<FMPReport><File><FileReferences count="2">	Any numeric value.	Number of file references found in the database referenced under <File Name> attribute.
<FMPReport><File><CustomMenuSets count="2">	Any numeric value.	Number of custom menu sets found in the database referenced under <File Name> attribute.
<FMPReport><File><CustomMenus count="2">	Any numeric value.	Number of custom menus found in the database referenced under <File Name> attribute.

General Section

Tag Name	Value	Description
<FMPReport	—	The top most parent node.
type="Report"	Can have one of the following values: <ul style="list-style-type: none">■ Summary■ Report	Stores the type of the XML report file. This value is used by the XSL file to determine if we are in summary mode or report mode.
version="11.0v1"	FMPPro Advanced version/vrev	Version/vrev of FileMaker Pro Advanced that generated this report.
creationDate="1/1/2010"	Date string based on the system's locale	Contains the creation date of the report.
creationTime="2:01 pm"	Time string based on the system's locale.	Contains the creation time of the report.
link="Summary.xml"	Valid filename based on the OS platform.	Contains the XML summary report file name.
<FMPReport><File	—	XML node that contains the information about the database file report such as the original filename and the path of the report directory.
name="testfile.fp7"	Valid filename based on the OS platform.	No validation is performed in the text string content. It is only used for display.
path="D:\Location" />	Platform specific file path.	Path of the XML report file of the database file.
<FMPReport><File><Options>	—	File specific options of the database file.
<FMPReport><File><Options><OnOpen>	—	Applicable options when the database file is opened.
<FMPReport><File><Options><OnOpen> <Account name="PowerUsers">	—	The account used on File Open.
<FMPReport><File><Options><OnOpen> <Script name="MyScript" id="123" >	—	This element exists when there is a script specified to be performed on File Open.
<FMPReport><File><Options><OnOpen> <Layout name = "MyLayout" id="431" >	—	This element exists when there is a layout specified to be switched to on File Open.
<FMPReport><File><Options><DefaultCustomMenuSet>	—	
<FMPReport><File><Options><DefaultCustomMenuSet> <CustomMenuSet name="menu set 1" id="2">	—	This element exists when there is a default custom menu set specified to be switched to.
<FMPReport><File><Options><OnClose>	—	Applicable options when the database file is closed.
<FMPReport><File><Options><OnClose> <Script name="MyCloseScript" id="222" >	—	This element exists when there is a script specified to be performed on Close File.

File Reference Section

All nodes below start with <FMPReport><File>

Tag Name	Value	Description
<FileReferenceCatalog>	—	XML node for catalog of file references and data sources.
<FileReferenceCatalog><FileReference	—	XML node for the file reference.
name="Report"	Any valid file reference name.	—
id = "1"	Internal unique positive integer value indicating creating order.	—
link="file2_fp7.xml"	Valid filename based on the OS platform.	Contains the external XML detail report file name.
pathList="C:\path\>	Valid path list strings.	Each path is separated by the carriage return character.
<FileReferenceCatalog><OdbcDataSource	—	XML node for data source.
id="1"	Key of data source	—
name="Report"	Any valid name	—
link="file2_fp7.xml"	Valid filename based on the OS platform.	Contains the XML detail report file name.
DSN="..."	Any valid string	Name of DSN that's used.
promptForLogin="False"	Can have one of the following values: ■ True ■ False	Determines if user should be prompted for login credentials.
useSso="True"	Can have one of the following values: ■ True ■ False	Indicates whether user is using single sign-on or not.
<FileReferenceCatalog><OdbcDataSource><ssoSpn>	—	If using single sign-on, then this is the name that the user provides.
<FileReferenceCatalog><OdbcDataSource><Username>	—	Login username calc. Optional, exists only if data source has entered user name.
<FileReferenceCatalog><OdbcDataSource><Username><Calculation>...	—	XML node for calculation, same as in the rest of the grammar.
<FileReferenceCatalog><OdbcDataSource><Username><DisplayCalculation>...	—	XML display calculation node, same as in the rest of the grammar.
<FileReferenceCatalog><OdbcDataSource><Password>	—	Login password calc. Optional, exists only if data source has entered password.
<FileReferenceCatalog><OdbcDataSource><Password><Calculation>...	—	XML node for calculation, same as in the rest of the grammar.
<FileReferenceCatalog><OdbcDataSource><Password><DisplayCalculation>...	—	XML display calculation node, same as in the rest of the grammar.

Tag Name	Value	Description
<FileReferenceCatalog><OdbcDataSource><FilterTables	—	—
tableName="table"	Any valid text string	The table name to filter for. Optional, defaults to blank.
schemaName="schema"	Any valid text string	The schema name to filter for. Optional, defaults to blank.
catalogName="catalog"	Any valid text string	The catalog name to filter for. Optional, defaults to blank.
typeBasedFilter="True"	Can have one of the following values: ■ True ■ False	Attribute indicates if data source filters on object type, specifically identified below. Optional, defaults to False.
retrieveTables="True"	Can have one of the following values: ■ True ■ False	Attribute indicates if tables should be retrieved. Optional, defaults to False.
retrieveViews="True"	Can have one of the following values: ■ True ■ False	Attribute indicates if views should be retrieved. Optional, defaults to False.
retrieveSystemTables="True"	Can have one of the following values: ■ True ■ False	Attribute indicates if system tables should be retrieved. Optional, defaults to False.

BaseTable Section

Tag Name	Value	Description
<FMPReport><File><BaseTableCatalog>	—	XML node for catalog of (base) table definitions.
<FMPReport><File><BaseTableCatalog><BaseTable	—	XML node for the (base) table definition.
name="Table1"	Any valid table name.	—
shadow="True"	Can have one of the following values: ■ True ■ False	Indicates whether or not this table is a shadow table.
id="1"	Internal unique positive integer value indicating creating order.	—
records="12">	Stores the record numbers of a table.	—
<FMPReport><File><BaseTableCatalog><BaseTable><DataSourceRef		A reference to the data source associated with this table. Only available if the "shadow" attribute of the parent BaseTable is "True".
name="..."	Any valid string.	The name of the data source (data source names are unique.)

Tag Name	Value	Description
catalogName="catalog"	Any valid string.	The name of the remote table's catalog in the ODBC data source.
schemaName="schema"	Any valid string.	The name of the remote table's schema in the ODBC data source.
tableName="table">	Any valid string.	The name of the remote table's table name in the ODBC data source.

All nodes below start with <FMPReport><File><BaseTableCatalog><BaseTable>

Tag Name	Value	Description
<FieldCatalog>	—	XML node for catalog of fields.
<FieldCatalog><Field	—	XML node for a field.
name="Field1"	Any valid field name.	—
id="1"	Internal unique positive integer value indicating creating order.	—
fieldType="Normal"	Can have one of the following values: ■ Normal ■ Calculated ■ Summary ■ Invalid	Indicate the field type.
shadowType="Supplemental"	Can have one of the following values: ■ Shadow ■ Supplemental	Specifies the shadow field type. Only available if the parent BaseTable's "shadow" attribute is "True."
dataType="Binary">	Can have one of the following values: ■ Text ■ Number ■ Date ■ Time ■TimeStamp ■ Binary	Indicate what kind of data is stored in the field.
<FieldCatalog><Field><Calculation	—	XML node for a calculation.
alwaysEvaluate="True"	Can have one of the following values: ■ True ■ False	Attribute indicates if calculation is always evaluated. This attribute is applicable to calculation in field definitions only.
table="Table1">	Valid table name.	Indicates the context table of the calculation. This attribute is applicable to auto-enter calculation only.
<FieldCatalog><Field><Calculation><![CDATA[F1]]>	CDATA containing the calculation text.	—

Tag Name	Value	Description
<FieldCatalog><Field><DisplayCalculation>	—	XML node for a calculation. This XML node is for display purposes only. Basically, it breaks a calculation into sequential chunks.
<FieldCatalog><Field><DisplayCalculation><Chunk type="FieldRef">	Can have one of the following values: <ul style="list-style-type: none">■ FunctionRef■ FieldRef■ NoRef■ CustomFunctionRef	Chunk type. FunctionRef indicates that the chunk is a calculation function. FieldRef indicates that the chunk is a field. NoRef indicates that the chunk has no special references, but is just ordinary text. CustomFunctionRef indicates that the chunk is a custom function.
<FieldCatalog><Field><DisplayCalculation><Chunk><Field	—	XML node for a field.
name = "F1"	Valid field name.	—
id = "2"	Internal unique positive integer value indicating creating order.	—
table = "Customer1"	Table occurrence name.	—
repetition = "2"	If repetition is "1", then it is implicit, no need to output it.	—
shadowType="Supplemental">	Can have one of the following values: <ul style="list-style-type: none">■ Shadow■ Supplemental	Specifies the shadow field type. Only available if the parent BaseTable's "shadow" attribute is "True."
<FieldCatalog><Field><SummaryInfo	—	XML node for field summary.
operation="Total"	Can have one of the following values: <ul style="list-style-type: none">■ Total■ RunningTotal■ Average■ WeightedAverage■ Count■ RunningCount■ Minimum■ Maximum■ StdDeviation■ StdDeviationByPopulation■ Fractional■ FractionalSubtotal	Summary operation.
summarizeRepetition="Individually"	Can have one of the following values: <ul style="list-style-type: none">■ Together■ Individually	Summarize repetition property.
restartForEachSortedGroup="True">	Can have one of the following values: <ul style="list-style-type: none">■ True■ False	This attribute is applicable only if the operation is RunningTotal or RunningCount.
<FieldCatalog><Field><SummaryInfo><SummaryField>	—	XML node representing the field to summarize.
<FieldCatalog><Field><SummaryInfo><SummaryField><Field	—	XML node for a field.

Tag Name	Value	Description
name="Field2"	Valid field name.	—
id = "2"	Internal unique positive integer value indicating creation order.	—
shadowType="Supplemental">	Can have one of the following values: <ul style="list-style-type: none">■ Shadow■ Supplemental	Specifies the shadow field type. Only available if the parent BaseTable's "shadow" attribute is "True."
<FieldCatalog><Field><SummaryInfo><AdditionalField>	—	XML node representing the additional field to summarize.
<FieldCatalog><Field><SummaryInfo><AdditionalField><Field	—	—
name="Field2"	Valid field name.	—
id = "2"	Internal unique positive integer value indicating creation order.	—
table="Table1"	Table occurrence name.	—
repetition="2"	If repetition is "1", then it is implicit, no need to output it.	—
shadowType="Supplemental">	Can have one of the following values: <ul style="list-style-type: none">■ Shadow■ Supplemental	Specifies the shadow field type. Only available if the parent BaseTable's "shadow" attribute is "True."
<FieldCatalog><Field><Comment>	Any text string.	XML node containing the comment information of a field definition.
<FieldCatalog><Field><AutoEnter	—	XML node representing the auto-enter information of a field.
value="CreationDate"	Can have one of the following values: <ul style="list-style-type: none">■ CreationTime■ CreationDate■ CreationTimeStamp■ CreationName■ CreationAccountName■ ModificationDate■ ModificationTime■ ModificationTimeStamp■ ModificationName■ ModificationAccountName■ PreviousRecord■ ConstantData	Auto-enter type
allowEditing="True"	Can have one of the following values: <ul style="list-style-type: none">■ True■ False	Attribute indicates if user is prohibited from modifying field value during data entry.

Tag Name	Value	Description
calculation="True"	Can have one of the following values: <ul style="list-style-type: none">■ True■ False	Attribute indicates if the auto-enter calculation is applicable.
lookup="True"	Can have one of the following values: <ul style="list-style-type: none">■ True■ False	Attribute indicates if the auto-enter lookup information is applicable.
furigana="True"	Can have one of the following values: <ul style="list-style-type: none">■ True■ False	Attribute indicates if the furigana information is applicable.
alwaysEvaluate="True"	Can have one of the following values: <ul style="list-style-type: none">■ True■ False	Attribute indicates if calculation is always evaluated. This attribute is applicable to calculation in field definitions only.
constant="True">	Can have one of the following values: <ul style="list-style-type: none">■ True■ False	Attribute indicates if the constant data information is applicable.
<FieldCatalog><Field><AutoEnter><Serial	—	Auto-enter serial information.
generate="OnCommit"	Can have one of the following values: <ul style="list-style-type: none">■ OnCommit■ OnCreation	Auto-enter serial generate type.
nextValue="1"	A float.	Next value.
increment="2">	Positive integer value in the range [1, 32767].	Increment value.
<FieldCatalog><Field><AutoEnter><ConstantData>	Any valid text string.	Auto-enter data.
<FieldCatalog><Field><AutoEnter><Calculation	—	XML node for a calculation.
table="Table2">	Valid table name.	Indicates the context table of the calculation. This attribute is applicable to auto-enter calculation only.
<FieldCatalog><Field><AutoEnter><Calculation><![CDATA[field1]]>	CDATA containing the calculation text.	—
<FieldCatalog><Field><AutoEnter><DisplayCalculation>	—	XML node for a calculation. This XMLnode is for display purposes only. Basically, it breaks a calculation into sequential chunks.
<FieldCatalog><Field><AutoEnter><DisplayCalculation><Chunk type="NoRef">	Can have one of the following values: <ul style="list-style-type: none">■ NoRef■ FunctionRef■ FieldRef■ CustomFunctionRef	Chunk type. FunctionRef indicates that the chunk is a calculation function. FieldRef indicates that the chunk is a field. NoRef indicates that the chunk has no special references, but is just ordinary text. CustomFunctionRef indicates that the chunk is a custom function.
<FieldCatalog><Field><AutoEnter><Lookup>	—	XML node containing the auto-enter lookup information.

Tag Name	Value	Description
<FieldCatalog><Field><AutoEnter><Lookup><Table		Table occurrence XML node. Represents the context table occurrence of the lookup.
name="Table"	Valid table occurrence name.	
id="2">	Internal unique positive integer value indicating creation order.	
<FieldCatalog><Field><AutoEnter><Lookup><Field	—	XML node for a field.
name="Field2"	Valid field name.	—
id = "2"	Internal unique positive integer value indicating creation order.	—
table="Table1"	Table occurrence name.	—
repetition="2">	If repetition is "1", then it is implicit, no need to output it.	—
<FieldCatalog><Field><AutoEnter><Lookup><NoMatchCopyOption	—	Lookup option.
value="DoNotCopy">	Can have one of the following values: ■ DoNotCopy ■ CopyNextLower ■ CopyNextHigher ■ CopyConstant	—
<FieldCatalog><Field><AutoEnter><Lookup><CopyConstantValue>	Any valid text string.	Lookup data information.
<FieldCatalog><Field><AutoEnter><Lookup><CopyEmptyContent	—	Lookup copy empty content option.
value="True">	Can have one of the following values: ■ True ■ False	—
<FieldCatalog><Field><Validation type = "Always"	Type can have the following values: ■ Always ■ OnlyDuringDataEntry	—
alwaysValidateCalculation = "True"	Can have one of the following values: ■ True ■ False	Always validate calculation.
calculation="True"	Can have one of the following values: ■ True ■ False	Indicates if the validation calculation is applicable.
valuelist="True"	Can have one of the following values: ■ True ■ False	Indicates if the validation value list is applicable.

Tag Name	Value	Description
<code>maxLength="True"</code>	<p>Can have one of the following values:</p> <ul style="list-style-type: none"> ■ True ■ False 	Indicates if the validation maximum of character option is applicable.
<code>message="True"></code>	<p>Can have one of the following values:</p> <ul style="list-style-type: none"> ■ True ■ False 	Indicates if the validation error message option is applicable.
<FieldCatalog><Field><Validation><StrictDataType value="Numeric">	<p>Can have one of the following values:</p> <ul style="list-style-type: none"> ■ Numeric ■ FourDigitYear ■ TimeOfDay 	—
<FieldCatalog><Field><Validation><NotEmpty value="True">	<p>Can have one of the following values:</p> <ul style="list-style-type: none"> ■ True ■ False 	—
<FieldCatalog><Field><Validation><Unique value="True">	<p>Can have one of the following values:</p> <ul style="list-style-type: none"> ■ True ■ False 	—

runFullAccess="True"	Can have one of the following values: ■ True ■ False	—
includeInMenu="True" >	Can have one of the following values: ■ True ■ False	—
<ScriptCatalog><Script><StepList>	—	—

Individual Steps are listed under <StepList>. The following table shows the XML grammar per script step.

Notes:

- Many script steps below have options/attributes which are only applicable if certain other options/attributes are enabled or set to a certain value. Examples of this are:
 - find requests for the 'Perform Find' script step (only applicable if 'Specify find requests' checkbox is checked)
 - file, calculation, or text for the 'Send Event' script step (only applicable if radio button is set to file, calculation or text respectively)

For the sake of discussion, let us call the former 'conditional' options/attributes and the latter 'enabling/determining' options/attributes. Though only applicable when the corresponding 'enabling/determining' option/attribute is appropriately set, once specified, 'conditional' options/attributes may very well be retained even after the 'enabling/determining' option/attribute is changed in such a way that the 'conditional' option/attributes are no longer applicable. This is done for the sake of convenience so that if/when the user ever

changes their mind and switches the 'enabling/determining' option/attribute back, so that the 'conditional' options/attributes are once again applicable, the last entered/chosen values for these 'conditional' options/attributes will still be present.

For example, in the case of a 'Perform Find' script step, previously specified find requests will be retained, even though the user may uncheck the 'Specify find requests' checkbox, so that, in case they decide to re-enable it, the last entered find will still be present, for the sake of convenience. Similarly, in the case of the 'Send Event' script step, a previously specified calculation will be retained, even though the user may switch to specifying a file, so that, in case they decide to switch back to a calculation, the last entered calculation will still be present, again for the sake of convenience.

As the last entered/chosen values of such currently inapplicable 'conditional' options/attributes are actually stored in the script step itself, corresponding XML for them is therefore generated when a DDR is performed. The fact that such options/attributes are reported should not therefore be construed as somehow implying they are applicable. Their applicability can/should be determined by checking the XML setting reported by the DDR for the corresponding 'enabling/determining' option/attribute.

- 2.** All script steps below contain the element <StepText> and many contain instances of the element <DisplayCalculation>. Both of these elements contain redundant information that only serves to make DDR reports (in particular, HTML ones) more readable.
